Extra Problem set - Just to keep you guys on the Road

Q: Some times we have to add some big numbers that they don't fit in "int", "long int" or even "long long int". in these situations we should save the number in an array and add the arrays element by element. this question is called "The Big Add Problem".

In this question you are asked to get two long numbers from the user (by using getchar()), saving them into two arrays (we prefer character array) and then calculate the summation and put the result into another character array.

Example :

```
>> Please Enter 1st Number :  
>> 8234567895432  
>>Please Enter Second Number :  
>>1111111111000000000000  
>> The Summation Would be :  
>> +11111111118234567895432
```

Another Example :

```
>> Please Enter 1st Number :  
>> 10000000000000000000  
>>Please Enter 2nd Number :  
>> -1  
>>The Summation Would be :  
>>9999999999999999999
```

This Question only helps you not forgetting the syntax. please solve it functionally and do it alone in order to be able to deal with complicated problems on your own.

#This problem set has no score ! so feel free to solve it anytime you want

Have Fun Every One !

Besides , Happy nowruz .
